# CRUD OPERATIONS

**Problem Statement** : Connecting JDBC to Eclipse for CRUD Operations with Menu Options.

## **Objective**

The objective of this project is to create a Java program in Eclipse that connects to a database using JDBC (Java Database Connectivity) and allows users to perform CRUD (Create, Read, Update, Delete) operations on a student table. The program will present users with a menu containing six options: insert, select, update student's name, update student's age, update student's gender, delete a record, and exit. Users will be able to interact with the program through the console to manipulate the student records stored in the database.

## **Detailed Requirements** :

- 1. Database Connectivity** - The program must establish a connection to a relational database management system (RDBMS) using JDBC. Database connection parameters such as URL, username, and password should be configurable and provided as constants or properties in the program.
- 2. Menu Options** - The program should display a menu with options like Insert, Select, Update Student's name, Update Student's age, Update Student's gender, Delete and Exit option. Users will input the corresponding option number to execute the desired operation.
- 3. Insert Operation** - Upon selecting the insert option, users will be prompted to input the student's ID, name, age, marks, and gender through the keyboard. The program will then insert this data into the student table in the database.
- 4. Select Operation** - Selecting the select option will display all records from the student table. The program should fetch and display the student ID, name, age, marks, and gender for each record in the table.
- 5. Update Operation** - The program should provide separate options to update the student's name, age, and gender. Upon selecting any of these options, users will input the student ID whose details need to be updated, followed by the new value for the corresponding field. The program will then update the specified field for the given student ID in the database.
- 6. Delete Operation** - Selecting the delete option will prompt users to input the student ID of the record they want to delete. The program will delete the record with the specified student ID from the student table in the database.
- 7. Error Handling** - The program should handle exceptions gracefully, displaying meaningful

error messages to users in case of connection failures, SQL errors, or invalid input. It should also validate user inputs to prevent SQL injection attacks or database errors due to incorrect data formats.

**7. Exit** - Upon selecting the exit option, the program will terminate gracefully, closing any open resources and releasing database connections.

**Tools and Technologies used** : Eclipse IDE and Oracle Database 21C Express Edition

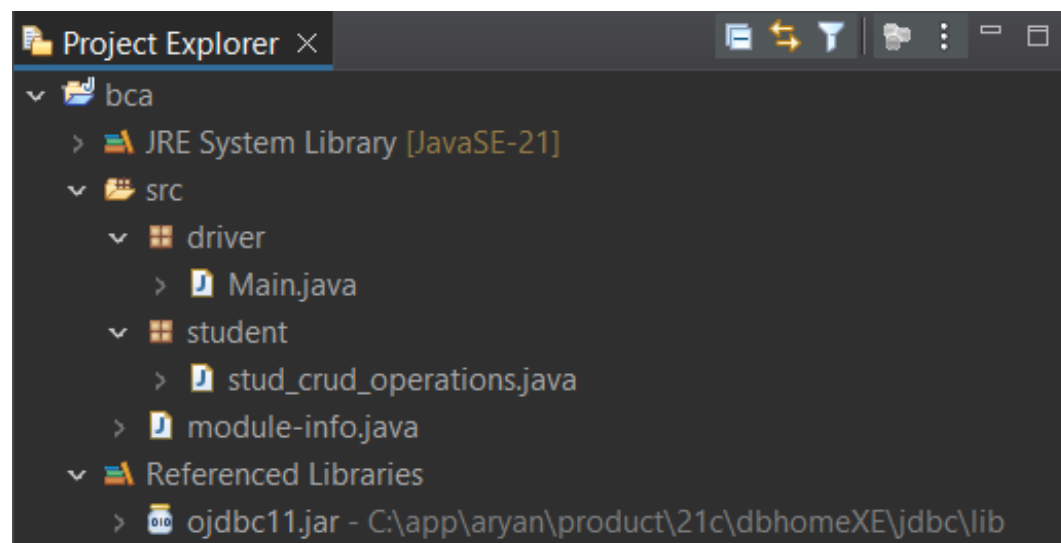

## **Design**

**Table description -**

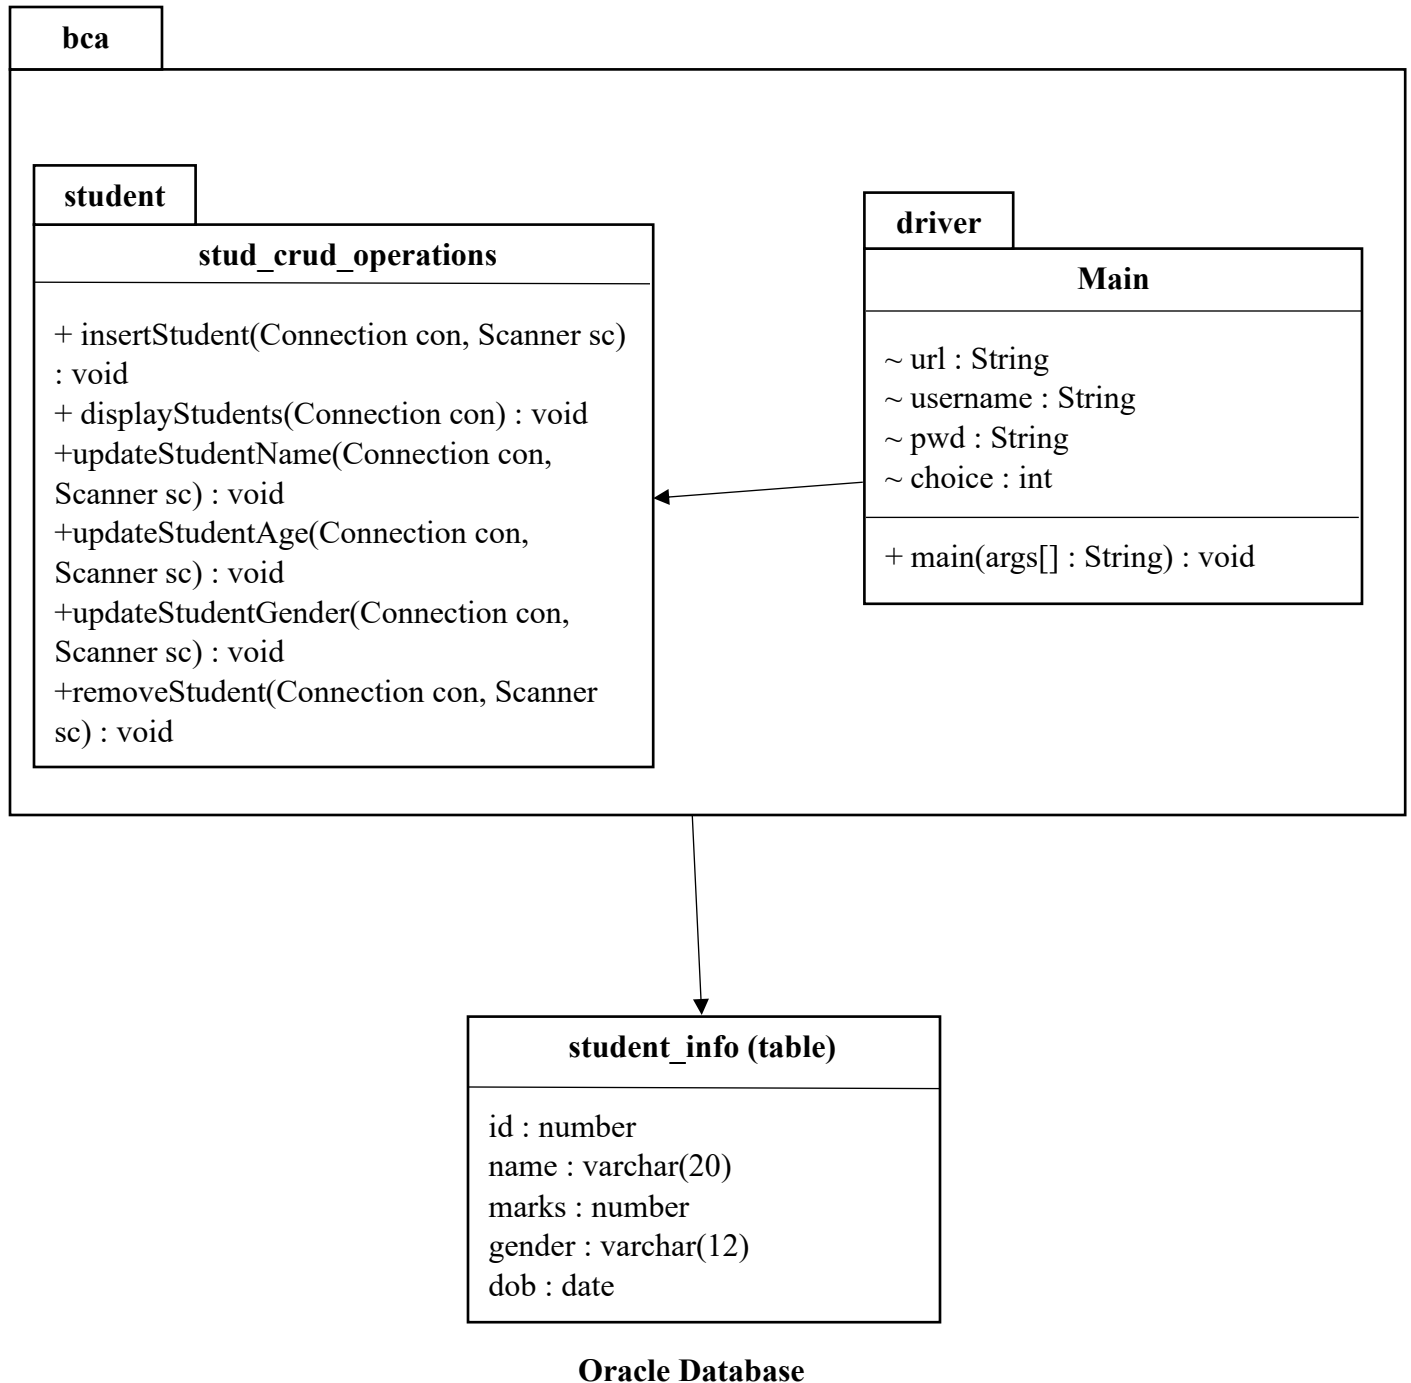

```
SQL> desc student_info;
```

Name	Null?	Type
ID		NUMBER
NAME		VARCHAR2(20)
AGE		NUMBER
MARKS		NUMBER
GENDER		VARCHAR2(12)

**Project Explorer -**

**Class Diagram** – The class diagram for our project will be as follows :

## CODE

### stud crud operations.java

```
package student;

import java.sql.Connection;
import java.sql.ResultSet;
import java.sql.SQLException;
import java.sql.Statement;
import java.util.Scanner;

public class stud_crud_operations {
    public stud_crud_operations() {
        super();
    }

    public void insertStudent(Connection con, Scanner sc) throws
    SQLException {
        Statement st = con.createStatement();
        System.out.println("Enter the student's Id: ");
        int id = sc.nextInt();

        System.out.println("Enter the student's name: ");
        String name = sc.next();

        System.out.println("Enter the student's age: ");
        int age = sc.nextInt();

        System.out.println("Enter the student's marks: ");
        double marks = sc.nextDouble();

        System.out.println("Enter the student's gender: ");
```

## CODE

```
String gender = sc.next();

String query = String.format("insert into student_info
values(%d, '%s', %d, %f, '%s')", id, name, age, marks, gender);

int rowsAffected = st.executeUpdate(query);

System.out.println(rowsAffected + " record
inserted!!!");

}
